

HIMALAYA PLAST

Manufacturer of uPVC Gaskets & TPE Extrusion Profiles

The Himalaya Plast Operating System

*Built on **ERPNext***

From WhatsApp, Excel and paper QC sheets to one connected factory operating system — proposed on a proven, open-source ERP.

Right Now, the Factory Runs on Memory

1

Order Tracking

No live visibility — status only exists by asking three different people.

2

Production Planning

Machine scheduling lives in one person's experience, not in a system.

3

Quality Control

QC sheets are paper. No digital history, no trend analysis.

4

Inventory

No batch tracking, no consumption tracking, no material traceability.

5

Dispatch

Manual document handling — no centralized dispatch screen.

6

Founder Visibility

No single dashboard for business health, risk orders, or payments due.

THE INSIGHT

Not a New System. A New Screen.

The HPOS brief describes customers, quotations, batches, machines, operators, quality inspections, cartons, invoices and payments. That is ERPNext's data model, almost object for object. The dispute is really about the UI layer, not the underlying system.

Requirement Coverage

■ Native ERPNext Configuration ■ Custom Development (hpos_extensions)

Eight Native Modules Cover Most of the Brief

Order to Cash, End to End

Every arrow above is a native ERPNext document link. Batch, machine, and operator stay attached to the order from Quotation through to Payment.

Sales: Order Capture to Cash

Approval Method (Email / WhatsApp / Phone / Verbal) is captured as a Select custom field at the moment Sales Order status moves to Approved — configuration, not code.

● Native ERPNext

● Light customization

Buying: Supplier to Stock

Purchase Receipt is ERPNext's native GRN. Batch number, supplier, and received quantity are captured at the point of receipt, before the QC decision releases stock.

● Native ERPNext

Manufacturing: BOM to Finished Batch

Job Card carries the Workstation (Machine) and Employee (Operator) natively — the same fields the brief's Production Module asks for.

Quality: Inspection to Decision

Four-state outcome needs a Frappe Workflow on top of native Accepted / Rejected

Pin Size, Width, Leg, Weight and Profile Fit Test become Reading parameters on a Quality Inspection Template — one template per product code.

Batch Genealogy: Raw Material to Customer

The single strongest argument in this whole proposal. If a customer reports a defect, the batch chain runs backwards from the Delivery Note through the FG Batch, the Work Order, and the exact raw material batch that fed it — plus every other order that used the same batch. What is a multi-day paper investigation today becomes a five-minute query.

Native ERPNext

From QC Pass to Truck Departure

Packing Slip exists in ERPNext specifically for case/carton-wise packing against a Delivery Note — a genuinely strong native fit for the brief's carton tracking requirement.

● Native ERPNext

Invoicing, e-Way Bill & Payment

The India Compliance app (open source, no license cost) generates the IRN and QR code on Sales Invoice submit, and the E-Way Bill from the same document — both print on the dispatch bundle.

● Native ERPNext + India Compliance app

Five Screens, One Custom App

All five live inside a single custom Frappe app (hpos_extensions), reading and writing the same Work Order, Job Card, and Delivery Note data as the native modules — not a parallel system to maintain.

Five Phases, Working System From Week 8

The highest-effort custom item — the Planning Board — is deliberately pushed to Phase 3, once real production data exists to design its capacity view against. Himalaya Plast has a working system after Phase 1, roughly eight weeks in.
